

Ion Channels

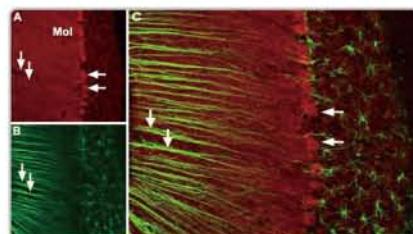

Ion channels are pore-forming, usually multimeric plasma membrane proteins that can open and close in response to chemical, temperature, or mechanical signals. An open channel allows specific ions to rapidly traverse the transmembrane passageway along an electrochemical gradient, generating an electrical signal that is propagated along excitable cells. Ion channels are of immense importance in clinical medicine as they are linked to a broad array of disorders and are targets of an ever-expanding, and commonly prescribed, armamentarium of pharmacologic agents. Nevertheless, there remains a great void in our understanding of ion channel biology, which limits our ability to develop more effective and more specific drugs.

GeneTex offers an outstanding selection of antibodies to support ion channel research. Please see the highlighted antibodies on the next page or review our complete list of related products on the GeneTex website.
