

# PI3K-Akt-mTOR Pathway

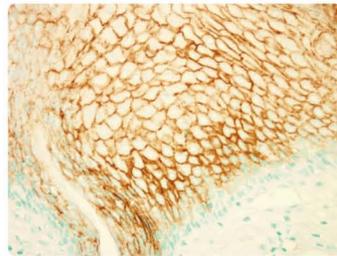

Akt, also known as protein kinase B (PKB), is a serine/threonine kinase that plays an important role in oncogenesis and the cellular processes of metabolism, apoptosis and autophagy. After being recruited to the plasma membrane by PIP<sub>3</sub>, Akt is activated through phosphorylation of either T308 or S473 by an activating kinase. The availability of PIP<sub>3</sub> at the plasma membrane is tightly regulated by the opposing actions of PI 3-Kinase (PI3K), which phosphorylates PIP<sub>2</sub> to PIP<sub>3</sub>, and PTEN, which dephosphorylates PIP<sub>3</sub> and abrogates Akt recruitment. The constitutive activation of PI3K and the loss of PTEN function are both associated with oncogenic progression. The mammalian target of rapamycin (mTOR) has been identified as the critical downstream mediator of Akt's oncogenic properties. The mTORC1 complex, composed of mTOR, GβL, Raptor and PRAS40 induces cell growth by stimulating protein synthesis, driving cell cycle progression and inhibiting autophagy. mTOR can also associate with different proteins to form the functionally distinct complex, rapamycin-insensitive mTORC2. It has recently been discovered that mTORC2 directly phosphorylates and activates Akt, indicating that mTOR plays key roles both upstream and downstream of Akt. GeneTex is proud to offer a complete line of antibodies for studying the various components of the PI3K-Akt-mTOR signaling pathway.

**PI3K p85β antibody (GTX111689):**  
WB analysis of (A) Jurkat and (B) Raji cell lysates.

**PI3K p101 antibody (GTX107813):**  
IHC-P analysis of normal human esophagus tissue.

**PTEN (phospho Ser380 /Thr382/ Thr383) antibody (GTX38637):**  
WB analysis of extract from HT29 cells untreated or treated with calyculin A.
